

**Wilson C, Pollock MR, Harris AD (1946).** Diet in the treatment of infective hepatitis. Lancet 1:881-883.

### Key passages

A series of 103 Service cases was studied, alternate patients serving as controls. The effects of differences in the fat-content of the diet were studied in the same series of patients, alternate members of the control and treated groups being placed on high-fat or restricted-fat diet (approximately 200 g. and 70 g. of fat respectively) during the period of biluria. The protein content of the diet was similar in both groups and was maintained at approximately 100 g. after the appetite returned.
